Chapter 2

Projection Matrices

2.1 Definition

Definition 2.1 Let $x \in E^n = V \oplus W$. Then x can be uniquely decomposed into

$$x = x_1 + x_2$$
 (where $x_1 \in V$ and $x_2 \in W$).

The transformation that maps x into x_1 is called the projection matrix (or simply projector) onto V along W and is denoted as ϕ . This is a linear transformation; that is,

$$\phi(a_1 y_1 + a_2 y_2) = a_1 \phi(y_1) + a_2 \phi(y_2)$$
(2.1)

for any y_1 , $y_2 \in E^n$. This implies that it can be represented by a matrix. This matrix is called a projection matrix and is denoted by $P_{V.W}$. The vector transformed by $P_{V.W}$ (that is, $x_1 = P_{V.W}x$) is called the projection (or the projection vector) of x onto V along W.

Theorem 2.1 The necessary and sufficient condition for a square matrix P of order n to be the projection matrix onto $V = \operatorname{Sp}(P)$ along $W = \operatorname{Ker}(P)$ is given by

$$P^2 = P. (2.2)$$

We need the following lemma to prove the theorem above.

Lemma 2.1 Let P be a square matrix of order n, and assume that (2.2) holds. Then

$$E^n = \operatorname{Sp}(\mathbf{P}) \oplus \operatorname{Ker}(\mathbf{P}) \tag{2.3}$$

H. Yanai et al., *Projection Matrices, Generalized Inverse Matrices, and Singular Value Decomposition*, Statistics for Social and Behavioral Sciences, DOI 10.1007/978-1-4419-9887-3_2,

and

$$Ker(\mathbf{P}) = Sp(\mathbf{I}_n - \mathbf{P}). \tag{2.4}$$

Proof of Lemma 2.1. (2.3): Let $x \in \operatorname{Sp}(P)$ and $y \in \operatorname{Ker}(P)$. From x = Pa, we have $Px = P^2a = Pa = x$ and Py = 0. Hence, from $x+y=0 \Rightarrow Px+Py=0$, we obtain $Px=x=0 \Rightarrow y=0$. Thus, $\operatorname{Sp}(P) \cap \operatorname{Ker}(P)=\{0\}$. On the other hand, from $\dim(\operatorname{Sp}(P))+\dim(\operatorname{Ker}(P))=\operatorname{rank}(P)+(n-\operatorname{rank}(P))=n$, we have $E^n=\operatorname{Sp}(P) \oplus \operatorname{Ker}(P)$.

(2.4): We have $\mathbf{P}\mathbf{x} = \mathbf{0} \Rightarrow \mathbf{x} = (\mathbf{I}_n - \mathbf{P})\mathbf{x} \Rightarrow \operatorname{Ker}(\mathbf{P}) \subset \operatorname{Sp}(\mathbf{I}_n - \mathbf{P})$ on the one hand and $\mathbf{P}(\mathbf{I}_n - \mathbf{P}) \Rightarrow \operatorname{Sp}(\mathbf{I}_n - \mathbf{P}) \subset \operatorname{Ker}(\mathbf{P})$ on the other. Thus, $\operatorname{Ker}(\mathbf{P}) = \operatorname{Sp}(\mathbf{I}_n - \mathbf{P})$. Q.E.D.

Note When (2.4) holds, $P(I_n - P) = O \Rightarrow P^2 = P$. Thus, (2.2) is the necessary and sufficient condition for (2.4).

Proof of Theorem 2.1. (Necessity) For $\forall x \in E^n$, $y = Px \in V$. Noting that y = y + 0, we obtain

$$P(Px) = Py = y = Px \Longrightarrow P^2x = Px \Longrightarrow P^2 = P.$$

(Sufficiency) Let $V = \{y|y = Px, x \in E^n\}$ and $W = \{y|y = (I_n - P)x, x \in E^n\}$. From Lemma 2.1, V and W are disjoint. Then, an arbitrary $x \in E^n$ can be uniquely decomposed into $x = Px + (I_n - P)x = x_1 + x_2$ (where $x_1 \in V$ and $x_2 \in W$). From Definition 2.1, P is the projection matrix onto $V = \operatorname{Sp}(P)$ along $W = \operatorname{Ker}(P)$.

Let $E^n = V \oplus W$, and let $\boldsymbol{x} = \boldsymbol{x}_1 + \boldsymbol{x}_2$, where $\boldsymbol{x}_1 \in V$ and $\boldsymbol{x}_2 \in W$. Let $\boldsymbol{P}_{W,V}$ denote the projector that transforms \boldsymbol{x} into \boldsymbol{x}_2 . Then,

$$P_{V \cdot W} x + P_{W \cdot V} x = (P_{V \cdot W} + P_{W \cdot V}) x. \tag{2.5}$$

Because the equation above has to hold for any $x \in E^n$, it must hold that

$$I_n = P_{V \cdot W} + P_{W \cdot V}.$$

Let a square matrix P be the projection matrix onto V along W. Then, $Q = I_n - P$ satisfies $Q^2 = (I_n - P)^2 = I_n - 2P + P^2 = I_n - P = Q$, indicating that Q is the projection matrix onto W along V. We also have

$$PQ = P(I_n - P) = P - P^2 = O,$$
 (2.6)

implying that $\operatorname{Sp}(Q)$ constitutes the null space of P (i.e., $\operatorname{Sp}(Q) = \operatorname{Ker}(P)$). Similarly, QP = O, implying that $\operatorname{Sp}(P)$ constitutes the null space of Q (i.e., $\operatorname{Sp}(P) = \operatorname{Ker}(Q)$).

Theorem 2.2 Let $E^n = V \oplus W$. The necessary and sufficient conditions for a square matrix \mathbf{P} of order n to be the projection matrix onto V along W are:

(i)
$$Px = x$$
 for $\forall x \in V$, (ii) $Px = 0$ for $\forall x \in W$. (2.7)

Proof. (Sufficiency) Let $P_{V\cdot W}$ and $P_{W\cdot V}$ denote the projection matrices onto V along W and onto W along V, respectively. Premultiplying (2.5) by P, we obtain $P(P_{V\cdot W}x) = P_{V\cdot W}x$, where $PP_{W\cdot V}x = 0$ because of (i) and (ii) above, and $P_{V\cdot W}x \in V$ and $P_{W\cdot V}x \in W$. Since $Px = P_{V\cdot W}x$ holds for any x, it must hold that $P = P_{V\cdot W}$.

(Necessity) For any $x \in V$, we have x = x + 0. Thus, Px = x. Similarly, for any $y \in W$, we have y = 0 + y, so that Py = 0. Q.E.D.

Example 2.1 In Figure 2.1, \overrightarrow{OA} indicates the projection of z onto $\operatorname{Sp}(x)$ along $\operatorname{Sp}(y)$ (that is, $\overrightarrow{OA} = P_{Sp(x) \cdot Sp(y)} z$), where $P_{Sp(x) \cdot Sp(y)}$ indicates the projection matrix onto $\operatorname{Sp}(x)$ along $\operatorname{Sp}(y)$. Clearly, $\overrightarrow{OB} = (I_2 - P_{Sp(y) \cdot Sp(x)}) \times z$.

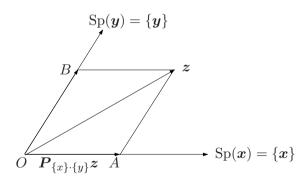

Figure 2.1: Projection onto $Sp(x) = \{x\}$ along $Sp(y) = \{y\}$.

Example 2.2 In Figure 2.2, \overrightarrow{OA} indicates the projection of z onto $V = \{x | x = \alpha_1 x_1 + \alpha_2 x_2\}$ along $\operatorname{Sp}(y)$ (that is, $\overrightarrow{OA} = P_{V \cdot Sp(y)}z$), where $P_{V \cdot Sp(y)}$ indicates the projection matrix onto V along $\operatorname{Sp}(y)$.

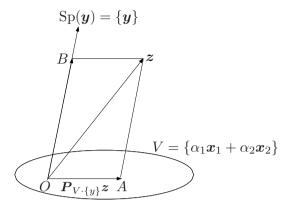

Figure 2.2: Projection onto a two-dimensional space V along $Sp(y) = \{y\}$.

Theorem 2.3 The necessary and sufficient condition for a square matrix P of order n to be a projector onto V of dimensionality r (dim(V) = r) is given by

$$P = T\Delta_r T^{-1}, (2.8)$$

where T is a square nonsingular matrix of order n and

$$\boldsymbol{\Delta}_r = \begin{bmatrix} 1 & \cdots & 0 & 0 & \cdots & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots \\ 0 & \cdots & 1 & 0 & \cdots & 0 \\ 0 & \cdots & 0 & 0 & \cdots & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots \\ 0 & \cdots & 0 & 0 & \cdots & 0 \end{bmatrix}.$$

(There are r unities on the leading diagonals, $1 \le r \le n$.)

Proof. (Necessity) Let $E^n = V \oplus W$, and let $\mathbf{A} = [\mathbf{a}_1, \mathbf{a}_2, \dots, \mathbf{a}_r]$ and $\mathbf{B} = [\mathbf{b}_1, \mathbf{b}_2, \dots \mathbf{b}_{n-r}]$ be matrices of linearly independent basis vectors spanning V and W, respectively. Let $\mathbf{T} = [\mathbf{A}, \mathbf{B}]$. Then \mathbf{T} is nonsingular, since $\operatorname{rank}(\mathbf{A}) + \operatorname{rank}(\mathbf{B}) = \operatorname{rank}(\mathbf{T})$. Hence, $\forall \mathbf{x} \in V$ and $\forall \mathbf{y} \in W$ can be expressed as

$$egin{aligned} x &= Alpha = [A,B] \left(egin{array}{c} lpha \ 0 \end{array}
ight) = T \left(egin{array}{c} lpha \ 0 \end{array}
ight), \ y &= Alpha = [A,B] \left(egin{array}{c} 0 \ eta \end{array}
ight) = T \left(egin{array}{c} 0 \ eta \end{array}
ight). \end{aligned}$$

Thus, we obtain

$$egin{aligned} oldsymbol{P}oldsymbol{x} = oldsymbol{x} \Longrightarrow oldsymbol{P}oldsymbol{T} \left(egin{array}{c} lpha \ 0 \end{array}
ight) = oldsymbol{T}oldsymbol{\Delta}_r \left(egin{array}{c} lpha \ 0 \end{array}
ight), \end{aligned}$$

$$egin{aligned} oldsymbol{P}oldsymbol{y} = oldsymbol{0} \Longrightarrow oldsymbol{P}oldsymbol{T} \left(egin{array}{c} oldsymbol{0} \ oldsymbol{eta} \end{array}
ight) = oldsymbol{T}oldsymbol{\Delta}_r \left(egin{array}{c} oldsymbol{0} \ oldsymbol{eta} \end{array}
ight). \end{aligned}$$

Adding the two equations above, we obtain

$$m{PT} \left(egin{array}{c} m{lpha} \ m{eta} \end{array}
ight) = m{T}m{\Delta}_r \left(egin{array}{c} m{lpha} \ m{eta} \end{array}
ight)\!.$$

Since $\begin{pmatrix} \alpha \\ \beta \end{pmatrix}$ is an arbitrary vector in the *n*-dimensional space E^n , it follows that

$$PT = T\Delta_r \Longrightarrow P = T\Delta_r T^{-1}$$
.

Furthermore, T can be an arbitrary nonsingular matrix since $V = \operatorname{Sp}(A)$ and $W = \operatorname{Sp}(B)$ such that $E^n = V \oplus W$ can be chosen arbitrarily.

(Sufficiency) P is a projection matrix, since $P^2 = P$, and rank(P) = r from Theorem 2.1. (Theorem 2.2 can also be used to prove the theorem above.)

Lemma 2.2 Let P be a projection matrix. Then,

$$rank(\mathbf{P}) = tr(\mathbf{P}). \tag{2.9}$$

Proof. rank(
$$P$$
) = rank($T\Delta_r T^{-1}$) = rank(Δ_r) = tr($T\Delta T^{-1}$) = tr(P). Q.E.D.

The following theorem holds.

Theorem 2.4 Let P be a square matrix of order n. Then the following three statements are equivalent.

$$P^2 = P, (2.10)$$

$$rank(\mathbf{P}) + rank(\mathbf{I}_n - \mathbf{P}) = n, \tag{2.11}$$

$$E^{n} = \operatorname{Sp}(\mathbf{P}) \oplus \operatorname{Sp}(\mathbf{I}_{n} - \mathbf{P}). \tag{2.12}$$

Proof. (2.10) \rightarrow (2.11): It is clear from rank(P) = tr(P).

 $(2.11) \rightarrow (2.12)$: Let $V = \operatorname{Sp}(\mathbf{P})$ and $W = \operatorname{Sp}(\mathbf{I}_n - \mathbf{P})$. Then, $\dim(V + W) = \dim(V) + \dim(W) - \dim(V \cap W)$. Since $\mathbf{x} = \mathbf{P}\mathbf{x} + (\mathbf{I}_n - \mathbf{P})\mathbf{x}$ for an arbitrary n-component vector \mathbf{x} , we have $E^n = V + W$. Hence, $\dim(V \cap W) = 0 \Longrightarrow V \cap W = \{\mathbf{0}\}$, establishing (2.12).

 $(2.12) \rightarrow (2.10)$: Postmultiplying $I_n = P + (I_n - P)$ by P, we obtain $P = P^2 + (I_n - P)P$, which implies $P(I_n - P) = (I_n - P)P$. On the other hand, we have $P(I_n - P) = O$ and $(I_n - P)P = O$ because $\operatorname{Sp}(P(I_n - P)) \subset \operatorname{Sp}(P)$ and $\operatorname{Sp}((I_n - P)P) \subset \operatorname{Sp}(I_n - P)$. Q.E.D.

Corollary

$$P^2 = P \iff \operatorname{Ker}(P) = \operatorname{Sp}(I_n - P).$$
 (2.13)

Proof. (\Rightarrow) : It is clear from Lemma 2.1.

$$(\Leftarrow)$$
: Ker $(P) = \operatorname{Sp}(I_n - P) \Leftrightarrow P(I_n - P) = O \Rightarrow P^2 = P$. Q.E.D.

2.2 Orthogonal Projection Matrices

Suppose we specify a subspace V in E^n . There are in general infinitely many ways to choose its complement subspace $V^c = W$. We will discuss some of them in Chapter 4. In this section, we consider the case in which V and W are orthogonal, that is, $W = V^{\perp}$.

Let $x, y \in E^n$, and let x and y be decomposed as $x = x_1 + x_2$ and $y = y_1 + y_2$, where $x_1, y_1 \in V$ and $x_2, y_2 \in W$. Let P denote the projection matrix onto V along V^{\perp} . Then, $x_1 = Px$ and $y_1 = Py$. Since $(x_2, Py) = (y_2, Px) = 0$, it must hold that

$$egin{array}{lll} (m{x}, m{P}m{y}) &=& (m{P}m{x} + m{x}_2, m{P}m{y}) = (m{P}m{x}, m{P}m{y}) = (m{P}m{x}, m{P}m{y} + m{y}_2) = (m{P}m{x}, m{y}) = (m{x}, m{P}'m{y}) \end{array}$$

for any \boldsymbol{x} and \boldsymbol{y} , implying

$$P' = P. (2.14)$$

Theorem 2.5 The necessary and sufficient condition for a square matrix P of order n to be an orthogonal projection matrix (an orthogonal projector) is given by

(i)
$$\mathbf{P}^2 = \mathbf{P}$$
 and (ii) $\mathbf{P}' = \mathbf{P}$.

Proof. (Necessity) That $P^2 = P$ is clear from the definition of a projection matrix. That P' = P is as shown above.

(Sufficiency) Let $x = P\alpha \in \operatorname{Sp}(P)$. Then, $Px = P^2\alpha = P\alpha = x$. Let $y \in \operatorname{Sp}(P)^{\perp}$. Then, Py = 0 since (Px, y) = x'P'y = x'Py = 0 must

hold for an arbitrary x. From Theorem 2.2, P is the projection matrix onto $\operatorname{Sp}(P)$ along $\operatorname{Sp}(P)^{\perp}$; that is, the orthogonal projection matrix onto $\operatorname{Sp}(P)$.

Q.E.D.

Definition 2.2 A projection matrix P such that $P^2 = P$ and P' = P is called an orthogonal projection matrix (projector). Furthermore, the vector Px is called the orthogonal projection of x. The orthogonal projector P is in fact the projection matrix onto $\operatorname{Sp}(P)$ along $\operatorname{Sp}(P)^{\perp}$, but it is usually referred to as the orthogonal projector onto $\operatorname{Sp}(P)$. See Figure 2.3.

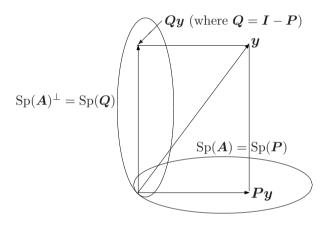

Figure 2.3: Orthogonal projection.

Note A projection matrix that does not satisfy P' = P is called an oblique projector as opposed to an orthogonal projector.

Theorem 2.6 Let $A = [a_1, a_2, \dots, a_m]$, where a_1, a_2, \dots, a_m are linearly independent. Then the orthogonal projector onto $V = \operatorname{Sp}(A)$ spanned by a_1, a_2, \dots, a_m is given by

$$P = A(A'A)^{-1}A'. (2.15)$$

Proof. Let $x_1 \in \operatorname{Sp}(A)$. From $x_1 = A\alpha$, we obtain $Px_1 = x_1 = A\alpha = A(A'A)^{-1}A'x_1$. On the other hand, let $x_2 \in \operatorname{Sp}(A)^{\perp}$. Then, $A'x_2 = 0 \Longrightarrow A(A'A)^{-1}A'x_2 = 0$. Let $x = x_1 + x_2$. From $Px_2 = 0$, we obtain $Px = A(A'A)^{-1}A'x$, and (2.15) follows because x is arbitrary.

Let $Q = I_n - P$. Then Q is the orthogonal projector onto $\operatorname{Sp}(A)^{\perp}$, the ortho-complement subspace of $\operatorname{Sp}(A)$.

Example 2.3 Let $\mathbf{1}_n = (1, 1, \dots, 1)'$ (the vector with n ones). Let \mathbf{P}_M denote the orthogonal projector onto $V_M = \operatorname{Sp}(\mathbf{1}_n)$. Then,

$$\boldsymbol{P}_{M} = \mathbf{1}_{n} (\mathbf{1}'_{n} \mathbf{1}_{n})^{-1} \mathbf{1}'_{n} = \begin{bmatrix} \frac{1}{n} & \cdots & \frac{1}{n} \\ \vdots & \ddots & \vdots \\ \frac{1}{n} & \cdots & \frac{1}{n} \end{bmatrix}.$$
 (2.16)

The orthogonal projector onto $V_M^{\perp} = \operatorname{Sp}(\mathbf{1}_n)^{\perp}$, the ortho-complement subspace of $\operatorname{Sp}(\mathbf{1}_n)$, is given by

$$I_{n} - P_{M} = \begin{bmatrix} 1 - \frac{1}{n} & -\frac{1}{n} & \cdots & -\frac{1}{n} \\ -\frac{1}{n} & 1 - \frac{1}{n} & \cdots & -\frac{1}{n} \\ \vdots & \vdots & \ddots & \vdots \\ -\frac{1}{n} & -\frac{1}{n} & \cdots & 1 - \frac{1}{n} \end{bmatrix}.$$
 (2.17)

Let

$$Q_M = I_n - P_M. \tag{2.18}$$

Clearly, P_M and Q_M are both symmetric, and the following relation holds:

$$P_M^2 = P_M, \ Q_M^2 = Q_M, \text{ and } P_M Q_M = Q_M P_M = O.$$
 (2.19)

Note The matrix Q_M in (2.18) is sometimes written as P_M^{\perp} .

Example 2.4 Let

$$\boldsymbol{x}_{R} = \begin{pmatrix} x_{1} \\ x_{2} \\ \vdots \\ x_{n} \end{pmatrix}, \quad \boldsymbol{x} = \begin{pmatrix} x_{1} - \bar{x} \\ x_{2} - \bar{x} \\ \vdots \\ x_{n} - \bar{x} \end{pmatrix}, \text{ where } \bar{x} = \frac{1}{n} \sum_{j=1}^{n} x_{j}.$$

Then,

$$x = Q_M x_R, (2.20)$$

and so

$$\sum_{j=1}^{n} (x_j - \bar{x})^2 = ||x||^2 = x'x = x'_R Q_M x_R.$$

The proof is omitted.

2.3 Subspaces and Projection Matrices

In this section, we consider the relationships between subspaces and projectors when the n-dimensional space E^n is decomposed into the sum of several subspaces.

2.3.1 Decomposition into a direct-sum of disjoint subspaces

Lemma 2.3 When there exist two distinct ways of decomposing E^n ,

$$E^n = V_1 \oplus W_1 = V_2 \oplus W_2, \tag{2.21}$$

and if $V_1 \subset W_2$ or $V_2 \subset W_1$, the following relation holds:

$$E^{n} = (V_{1} \oplus V_{2}) \oplus (W_{1} \cap W_{2}). \tag{2.22}$$

Proof. When $V_1 \subset W_2$, Theorem 1.5 leads to the following relation:

$$V_1 + (W_1 \cap W_2) = (V_1 + W_1) \cap W_2 = E^n \cap W_2 = W_2.$$

Also from $V_1 \cap (W_1 \cap W_2) = (V_1 \cap W_1) \cap W_2 = \{\mathbf{0}\}$, we have $W_2 = V_1 \oplus (W_1 \cap W_2)$. Hence the following relation holds:

$$E^{n} = V_{2} \oplus W_{2} = V_{2} \oplus V_{1} \oplus (W_{1} \cap W_{2}) = (V_{1} \oplus V_{2}) \oplus (W_{1} \cap W_{2}).$$

When $V_2 \subset W_2$, the same result follows by using $W_1 = V_2 \oplus (W_1 \cap W_2)$. Q.E.D.

Corollary When $V_1 \subset V_2$ or $W_2 \subset W_1$,

$$E^{n} = (V_{1} \oplus W_{2}) \oplus (V_{2} \cap W_{1}). \tag{2.23}$$

Proof. In the proof of Lemma 2.3, exchange the roles of W_2 and V_2 . Q.E.D.

Theorem 2.7 Let P_1 and P_2 denote the projection matrices onto V_1 along W_1 and onto V_2 along W_2 , respectively. Then the following three statements are equivalent:

- (i) $P_1 + P_2$ is the projector onto $V_1 \oplus V_2$ along $W_1 \cap W_2$.
- (ii) $P_1P_2 = P_2P_1 = O$.
- (iii) $V_1 \subset W_2$ and $V_2 \subset W_1$. (In this case, V_1 and V_2 are disjoint spaces.)

Proof. (i) \rightarrow (ii): From $(P_1+P_2)^2 = P_1+P_2$, $P_1^2 = P_1$, and $P_2^2 = P_2$, we

- have $P_1P_2 = -P_2P_1$. Pre- and postmutiplying both sides by P_1 , we obtain $P_1P_2 = -P_1P_2P_1$ and $P_1P_2P_1 = -P_2P_1$, respectively, which imply $P_1P_2 = P_2P_1$. This and $P_1P_2 = -P_2P_1$ lead to $P_1P_2 = P_2P_1 = O$.
- (ii) \rightarrow (iii): For an arbitrary vector $\mathbf{x} \in V_1$, $\mathbf{P}_1 \mathbf{x} = \mathbf{x}$ because $\mathbf{P}_1 \mathbf{x} \in V_1$. Hence, $\mathbf{P}_2 \mathbf{P}_1 \mathbf{x} = \mathbf{P}_2 \mathbf{x} = \mathbf{0}$, which implies $\mathbf{x} \in W_2$, and so $V_1 \subset W_2$. On the other hand, when $\mathbf{x} \in V_2$, it follows that $\mathbf{P}_2 \mathbf{x} \in V_2$, and so $\mathbf{P}_1 \mathbf{P}_2 \mathbf{x} = \mathbf{P}_1 \mathbf{x} = \mathbf{0}$, implying $\mathbf{x} \in W_2$. We thus have $V_2 \subset W_2$.
- (iii) \rightarrow (ii): For $\boldsymbol{x} \in E^n$, $\boldsymbol{P}_1 \boldsymbol{x} \in V_1$, which implies $(\boldsymbol{I}_n \boldsymbol{P}_2) \boldsymbol{P}_1 \boldsymbol{x} = \boldsymbol{P}_1 \boldsymbol{x}$, which holds for any \boldsymbol{x} . Thus, $(\boldsymbol{I}_n \boldsymbol{P}_2) \boldsymbol{P}_1 = \boldsymbol{P}_1$, implying $\boldsymbol{P}_1 \boldsymbol{P}_2 = \boldsymbol{O}$. We also have $\boldsymbol{x} \in E^n \Rightarrow \boldsymbol{P}_2 \boldsymbol{x} \in V_2 \Rightarrow (\boldsymbol{I}_n \boldsymbol{P}_1) \boldsymbol{P}_2 \boldsymbol{x} = \boldsymbol{P}_2 \boldsymbol{x}$, which again holds for any \boldsymbol{x} , which implies $(\boldsymbol{I}_n \boldsymbol{P}_1) \boldsymbol{P}_2 = \boldsymbol{P}_2 \Rightarrow \boldsymbol{P}_1 \boldsymbol{P}_2 = \boldsymbol{O}$. Similarly, $\boldsymbol{P}_2 \boldsymbol{P}_1 = \boldsymbol{O}$.
- (ii) \rightarrow (i): An arbitrary vector $\boldsymbol{x} \in (V_1 \oplus V_2)$ can be decomposed into $\boldsymbol{x} = \boldsymbol{x}_1 + \boldsymbol{x}_2$, where $\boldsymbol{x}_1 \in V_1$ and $\boldsymbol{x}_2 \in V_2$. From $\boldsymbol{P}_1\boldsymbol{x}_2 = \boldsymbol{P}_1\boldsymbol{P}_2\boldsymbol{x} = \boldsymbol{0}$ and $\boldsymbol{P}_2\boldsymbol{x}_1 = \boldsymbol{P}_2\boldsymbol{P}_1\boldsymbol{x} = \boldsymbol{0}$, we have $(\boldsymbol{P}_1 + \boldsymbol{P}_2)\boldsymbol{x} = (\boldsymbol{P}_1 + \boldsymbol{P}_2)(\boldsymbol{x}_1 + \boldsymbol{x}_2) = \boldsymbol{P}_1\boldsymbol{x}_1 + \boldsymbol{P}_2\boldsymbol{x}_2 = \boldsymbol{x}_1 + \boldsymbol{x}_2 = \boldsymbol{x}$. On the other hand, by noting that $\boldsymbol{P}_1 = \boldsymbol{P}_1(\boldsymbol{I}_n \boldsymbol{P}_2)$ and $\boldsymbol{P}_2 = \boldsymbol{P}_2(\boldsymbol{I}_n \boldsymbol{P}_1)$ for any $\boldsymbol{x} \in (W_1 \cap W_2)$, we have $(\boldsymbol{P}_1 + \boldsymbol{P}_2)\boldsymbol{x} = \boldsymbol{P}_1(\boldsymbol{I}_n \boldsymbol{P}_2)\boldsymbol{x} + \boldsymbol{P}_2(\boldsymbol{I}_n \boldsymbol{P}_1)\boldsymbol{x} = \boldsymbol{0}$. Since $V_1 \subset W_2$ and $V_2 \subset W_1$, the decomposition on the right-hand side of (2.22) holds. Hence, we know $\boldsymbol{P}_1 + \boldsymbol{P}_2$ is the projector onto $V_1 \oplus V_2$ along $W_1 \cap W_2$ by Theorem 2.2.

Note In the theorem above, $P_1P_2 = O$ in (ii) does not imply $P_2P_1 = O$. $P_1P_2 = O$ corresponds with $V_2 \subset W_1$, and $P_2P_1 = O$ with $V_1 \subset W_2$ in (iii). It should be clear that $V_1 \subset W_2 \iff V_2 \subset W_1$ does not hold.

Theorem 2.8 Given the decompositions of E^n in (2.21), the following three statements are equivalent:

- (i) $P_2 P_1$ is the projector onto $V_2 \cap W_1$ along $V_1 \oplus W_2$.
- (ii) $P_1P_2 = P_2P_1 = P_1$.
- (iii) $V_1 \subset V_2$ and $W_2 \subset W_1$.
- **Proof.** (i) \rightarrow (ii): $(P_2 P_1)^2 = P_2 P_1$ implies $2P_1 = P_1P_2 + P_2P_1$. Pre- and postmultiplying both sides by P_2 , we obtain $P_2P_1 = P_2P_1P_2$ and $P_1P_2 = P_2P_1P_2$, respectively, which imply $P_1P_2 = P_2P_1 = P_1$.
- (ii) \rightarrow (iii): For $\forall x \in E^n$, $P_1x \in V_1$, which implies $P_1x = P_2P_1x \in V_2$, which in turn implies $V_1 \subset V_2$. Let $Q_j = I_n P_j$ (j = 1, 2). Then, $P_1P_2 = P_1$ implies $Q_1Q_2 = Q_2$, and so $Q_2x \in W_2$, which implies $Q_2x = Q_1Q_2x \in W_1$, which in turn implies $W_2 \subset W_1$.

(iii) \rightarrow (ii): From $V_1 \subset V_2$, for $\forall x \in E^n$, $P_1 x \in V_1 \subset V_2 \Rightarrow P_2(P_1 x) = P_1 x \Rightarrow P_2 P_1 = P_1$. On the other hand, from $W_2 \subset W_1$, $Q_2 x \in W_2 \subset W_1$ for $\forall x \in E^n \Rightarrow Q_1 Q_2 x = Q_2 x \Rightarrow Q_1 Q_2 Q_2 \Rightarrow (I_n - P_1)(I_n - P_2) = (I_n - P_2) \Rightarrow P_1 P_2 = P_1$.

(ii) \rightarrow (i): For $\boldsymbol{x} \in (V_2 \cap W_1)$, it holds that $(\boldsymbol{P}_2 - \boldsymbol{P}_1)\boldsymbol{x} = \boldsymbol{Q}_1\boldsymbol{P}_2\boldsymbol{x} = \boldsymbol{Q}_1\boldsymbol{x} = \boldsymbol{x}$. On the other hand, let $\boldsymbol{x} = \boldsymbol{y} + \boldsymbol{z}$, where $\boldsymbol{y} \in V_1$ and $\boldsymbol{z} \in W_2$. Then, $(\boldsymbol{P}_2 - \boldsymbol{P}_1)\boldsymbol{x} = (\boldsymbol{P}_2 - \boldsymbol{P}_1)\boldsymbol{y} + (\boldsymbol{P}_2 - \boldsymbol{P}_1)\boldsymbol{z} = \boldsymbol{P}_2\boldsymbol{Q}_1\boldsymbol{y} + \boldsymbol{Q}_1\boldsymbol{P}_2\boldsymbol{z} = \boldsymbol{0}$. Hence, $\boldsymbol{P}_2 - \boldsymbol{P}_1$ is the projector onto $V_2 \cap W_1$ along $V_1 \oplus W_2$. Q.E.D.

Note As in Theorem 2.7, $P_1P_2 = P_1$ does not necessarily imply $P_2P_1 = P_1$. Note that $P_1P_2 = P_1 \iff W_2 \subset W_1$, and $P_2P_1 = P_1 \iff V_1 \subset V_2$.

Theorem 2.9 When the decompositions in (2.21) and (2.22) hold, and if

$$\boldsymbol{P}_1 \boldsymbol{P}_2 = \boldsymbol{P}_2 \boldsymbol{P}_1, \tag{2.24}$$

then P_1P_2 (or P_2P_1) is the projector onto $V_1 \cap V_2$ along $W_1 + W_2$.

Proof. $P_1P_2 = P_2P_1$ implies $(P_1P_2)^2 = P_1P_2P_1P_2 = P_1^2P_2^2 = P_1P_2$, indicating that P_1P_2 is a projection matrix. On the other hand, let $x \in V_1 \cap V_2$. Then, $P_1(P_2x) = P_1x = x$. Furthermore, let $x \in W_1 + W_2$ and $x = x_1 + x_2$, where $x_1 \in W_1$ and $x_2 \in W_2$. Then, $P_1P_2x = P_1P_2x_1 + P_1P_2x_2 = P_2P_1x_1 + 0 = 0$. Since $E^n = (V_1 \cap V_2) \oplus (W_1 \oplus W_2)$ by the corollary to Lemma 2.3, we know that P_1P_2 is the projector onto $V_1 \cap V_2$ along $W_1 \oplus W_2$.

Note Using the theorem above, (ii) \rightarrow (i) in Theorem 2.7 can also be proved as follows: From $P_1P_2=O$

$$Q_1Q_2 = (I_n - P_1)(I_n - P_2) = I_n - P_1 - P_2 = Q_2Q_1.$$

Hence, Q_1Q_2 is the projector onto $W_1 \cap W_2$ along $V_1 \oplus V_2$, and $P_1 + P_2 = I_n - Q_1Q_2$ is the projector onto $V_1 \oplus V_2$ along $W_1 \cap W_2$.

If we take $W_1 = V_1^{\perp}$ and $W_2 = V_2^{\perp}$ in the theorem above, \mathbf{P}_1 and \mathbf{P}_2 become orthogonal projectors.

Theorem 2.10 Let P_1 and P_2 be the orthogonal projectors onto V_1 and V_2 , respectively. Then the following three statements are equivalent:

- (i) $P_1 + P_2$ is the orthogonal projector onto $V_1 \oplus V_2$.
- (ii) $P_1P_2 = P_2P_1 = O$.
- (iii) V_1 and V_2 are orthogonal.

Theorem 2.11 The following three statements are equivalent:

- (i) $P_2 P_1$ is the orthogonal projector onto $V_2 \cap V_1^{\perp}$.
- (ii) $P_1P_2 = P_2P_1 = P_1$.
- (iii) $V_1 \subset V_2$.

The two theorems above can be proved by setting $W_1 = V_1^{\perp}$ and $W_2 = V_2^{\perp}$ in Theorems 2.7 and 2.8.

Theorem 2.12 The necessary and sufficient condition for P_1P_2 to be the orthogonal projector onto $V_1 \cap V_2$ is (2.24).

Proof. Sufficiency is clear from Theorem 2.9. Necessity follows from $P_1P_2 = (P_1P_2)'$, which implies $P_1P_2 = P_2P_1$ since P_1P_2 is an orthogonal projector. Q.E.D.

We next present a theorem concerning projection matrices when E^n is expressed as a direct-sum of m subspaces, namely

$$E^n = V_1 \oplus V_2 \oplus \cdots \oplus V_m. \tag{2.25}$$

Theorem 2.13 Let P_i $(i = 1, \dots, m)$ be square matrices that satisfy

$$P_1 + P_2 + \dots + P_m = I_n.$$
 (2.26)

Then the following three statements are equivalent:

$$\mathbf{P}_i \mathbf{P}_j = \mathbf{O} \ (i \neq j). \tag{2.27}$$

$$P_i^2 = P_i \ (i = 1, \dots m).$$
 (2.28)

$$rank(\mathbf{P}_1) + rank(\mathbf{P}_2) + \dots + rank(\mathbf{P}_m) = n.$$
 (2.29)

Proof. (i) \rightarrow (ii): Multiply (2.26) by P_i .

(ii)
$$\rightarrow$$
 (iii): Use rank(P_i) = tr(P_i) when $P_i^2 = P_i$. Then,

$$\sum_{i=1}^{m} \operatorname{rank}(\boldsymbol{P}_{i}) = \sum_{i=1}^{m} \operatorname{tr}(\boldsymbol{P}_{i}) = \operatorname{tr}\left(\sum_{i=1}^{m} \boldsymbol{P}_{i}\right) = \operatorname{tr}(\boldsymbol{I}_{n}) = n.$$

(iii) \rightarrow (i), (ii): Let $V_i = \operatorname{Sp}(\boldsymbol{P}_i)$. From $\operatorname{rank}(\boldsymbol{P}_i) = \dim(V_i)$, we obtain $\dim(V_1) + \dim(V_2) + \cdots \dim(V_m) = n$; that is, E^n is decomposed into the sum of m disjoint subspaces as in (2.26). By postmultiplying (2.26) by \boldsymbol{P}_i , we obtain

$$P_1P_i + P_2P_i + \cdots + P_i(P_i - I_n) + \cdots + P_mP_i = O.$$

Since $\operatorname{Sp}(\boldsymbol{P}_1), \operatorname{Sp}(\boldsymbol{P}_2), \cdots, \operatorname{Sp}(\boldsymbol{P}_m)$ are disjoint, (2.27) and (2.28) hold from Theorem 1.4. Q.E.D.

Note P_i in Theorem 2.13 is a projection matrix. Let $E^n = V_1 \oplus \cdots \oplus V_r$, and let

$$V_{(i)} = V_1 \oplus \cdots \oplus V_{i-1} \oplus V_{i+1} \oplus \cdots \oplus V_r. \tag{2.30}$$

Then, $E^n = V_i \oplus V_{(i)}$. Let $\mathbf{P}_{i \cdot (i)}$ denote the projector onto V_i along $V_{(i)}$. This matrix coincides with the \mathbf{P}_i that satisfies the four equations given in (2.26) through (2.29).

The following relations hold.

Corollary 1

$$P_{1\cdot(1)} + P_{2\cdot(2)} + \dots + P_{m\cdot(m)} = I_n, \tag{2.31}$$

$$P_{i\cdot(i)}^2 = P_{i\cdot(i)} \ (i = 1, \dots, m),$$
 (2.32)

$$\boldsymbol{P}_{i\cdot(i)}\boldsymbol{P}_{j\cdot(j)} = \boldsymbol{O} \ (i \neq j). \tag{2.33}$$

Corollary 2 Let $P_{(i)\cdot i}$ denote the projector onto $V_{(i)}$ along V_i . Then the following relation holds:

$$P_{(i)\cdot i} = P_{1\cdot(1)} + \dots + P_{i-1\cdot(i-1)} + P_{i+1\cdot(i+1)} + \dots + P_{m\cdot(m)}.$$
 (2.34)

Proof. The proof is straightforward by noting $P_{i\cdot(i)}+P_{(i)\cdot i}=I_n$. Q.E.D.

Note The projection matrix $P_{i\cdot(i)}$ onto V_i along $V_{(i)}$ is uniquely determined. Assume that there are two possible representations, $P_{i\cdot(i)}$ and $P_{i\cdot(i)}^*$. Then,

$$\boldsymbol{P}_{1\cdot(1)} + \boldsymbol{P}_{2\cdot(2)} + \dots + \boldsymbol{P}_{m\cdot(m)} = \boldsymbol{P}_{1\cdot(1)}^* + \boldsymbol{P}_{2\cdot(2)}^* + \dots + \boldsymbol{P}_{m\cdot(m)}^*,$$

from which

$$(P_{1\cdot(1)}-P_{1\cdot(1)}^*)+(P_{2\cdot(2)}-P_{2\cdot(2)}^*)+\cdots+(P_{m\cdot(m)}-P_{m\cdot(m)}^*)=O.$$

Each term in the equation above belongs to one of the respective subspaces V_1 , V_2 , \cdots , V_m , which are mutually disjoint. Hence, from Theorem 1.4, we obtain $\mathbf{P}_{i\cdot(i)} = \mathbf{P}_{i\cdot(i)}^*$. This indicates that when a direct-sum of E^n is given, an identity matrix \mathbf{I}_n of order n is decomposed accordingly, and the projection matrices that constitute the decomposition are uniquely determined.

The following theorem due to Khatri (1968) generalizes Theorem 2.13.

Theorem 2.14 Let P_i denote a square matrix of order n such that

$$P = P_1 + P_2 + \dots + P_m. \tag{2.35}$$

Consider the following four propositions:

- (i) $\mathbf{P}_i^2 = \mathbf{P}_i$ $(i = 1, \dots m),$
- (ii) $P_i P_j = O$ $(i \neq j)$, and $rank(P_i^2) = rank(P_i)$,
- (iii) $\mathbf{P}^2 = \mathbf{P}$,
- (iv) $\operatorname{rank}(\mathbf{P}) = \operatorname{rank}(\mathbf{P}_1) + \cdots + \operatorname{rank}(\mathbf{P}_m).$

All other propositions can be derived from any two of (i), (ii), and (iii), and (i) and (ii) can be derived from (iii) and (iv).

Proof. That (i) and (ii) imply (iii) is obvious. To show that (ii) and (iii) imply (iv), we may use

$$P^2 = P_1^2 + P_2^2 + \dots + P_m^2$$
 and $P^2 = P$,

which follow from (2.35).

(ii), (iii) \rightarrow (i): Postmultiplying (2.35) by P_i , we obtain $PP_i = P_i^2$, from which it follows that $P_i^3 = P_i^2$. On the other hand, $\operatorname{rank}(P_i^2) = \operatorname{rank}(P_i)$ implies that there exists W such that $P_i^2W_i = P_i$. Hence, $P_i^3 = P_i^2 \Rightarrow P_i^3W_i = P_i^2W_i \Rightarrow P_i(P_i^2W_i) = P_i^2W \Rightarrow P_i^2 = P_i$.

(iii), (iv) \rightarrow (i), (ii): We have $\operatorname{Sp}(P) \oplus \operatorname{Sp}(I_n - P) = E^n$ from $P^2 = P$. Hence, by postmultiplying the identity

$$P_1 + P_2 + \cdots + P_m + (I_n - P) = I_n$$

by
$$P$$
, we obtain $P_i^2 = P_i$, and $P_i P_j = O(i \neq j)$. Q.E.D.

Next we consider the case in which subspaces have inclusion relationships like the following.

Theorem 2.15 Let

$$E^n = V_k \supset V_{k-1} \supset \cdots \supset V_2 \supset V_1 = \{\mathbf{0}\},$$

and let W_i denote a complement subspace of V_i . Let P_i be the orthogonal projector onto V_i along W_i , and let $P_i^* = P_i - P_{i-1}$, where $P_0 = O$ and $P_k = I_n$. Then the following relations hold:

- (i) $I_n = P_1^* + P_2^* + \dots + P_k^*$
- (ii) $(\boldsymbol{P}_i^*)^2 = \boldsymbol{P}_i^*$.
- (iii) $P_i^* P_j^* = P_j^* P_i^* = O \ (i \neq j).$
- (iv) P_i is the projector onto $V_i \cap W_{i-1}$ along $V_{i-1} \oplus W_i$.

Proof. (i): Obvious. (ii): Use $P_iP_{i-1} = P_{i-1}P_i = P_{i-1}$. (iii): It follows from $(P_i^*)^2 = P_i^*$ that $\operatorname{rank}(P_i^*) = \operatorname{tr}(P_i^*) = \operatorname{tr}(P_i - P_{i-1}) = \operatorname{tr}(P_i) - \operatorname{tr}(P_{i-1})$. Hence, $\sum_{i=1}^k \operatorname{rank}(P_i^*) = \operatorname{tr}(P_k) - \operatorname{tr}(P_0) = n$, from which $P_i^*P_j^* = O$ follows by Theorem 2.13. (iv): Clear from Theorem 2.8(i).

Note The theorem above does not presuppose that P_i is an orthogonal projector. However, if $W_i = V_i^{\perp}$, P_i and P_i^* are orthogonal projectors. The latter, in particular, is the orthogonal projector onto $V_i \cap V_{i-1}^{\perp}$.

2.3.2 Decomposition into nondisjoint subspaces

In this section, we present several theorems indicating how projectors are decomposed when the corresponding subspaces are not necessarily disjoint. We elucidate their meaning in connection with the commutativity of projectors.

We first consider the case in which there are two direct-sum decompositions of E^n , namely

$$E^n = V_1 \oplus W_1 = V_2 \oplus W_2,$$

as given in (2.21). Let $V_{12} = V_1 \cap V_2$ denote the product space between V_1 and V_2 , and let V_3 denote a complement subspace to $V_1 + V_2$ in E^n . Furthermore, let P_{1+2} denote the projection matrix onto $V_{1+2} = V_1 + V_2$ along V_3 , and let P_j (j = 1, 2) represent the projection matrix onto V_j (j = 1, 2) along W_j (j = 1, 2). Then the following theorem holds.

Theorem 2.16 (i) The necessary and sufficient condition for $P_{1+2} = P_1 + P_2 - P_1 P_2$ is

$$(V_{1+2} \cap W_2) \subset (V_1 \oplus V_3).$$
 (2.36)

(ii) The necessary and sufficient condition for $P_{1+2} = P_1 + P_2 - P_2 P_1$ is

$$(V_{1+2} \cap W_1) \subset (V_2 \oplus V_3).$$
 (2.37)

Proof. (i): Since $V_{1+2} \supset V_1$ and $V_{1+2} \supset V_2$, $P_{1+2} - P_1$ is the projector onto $V_{1+2} \cap W_1$ along $V_1 \oplus V_3$ by Theorem 2.8. Hence, $P_{1+2}P_1 = P_1$ and $P_{1+2}P_2 = P_2$. Similarly, $P_{1+2} - P_2$ is the projector onto $V_{1+2} \cap W_2$ along $V_2 \oplus V_3$. Hence, by Theorem 2.8,

$$P_{1+2} - P_1 - P_2 + P_1 P_2 = O \iff (P_{1+2} - P_1)(P_{1+2} - P_2) = O.$$

Furthermore,

$$(P_{1+2} - P_1)(P_{1+2} - P_2) = O \iff (V_{1+2} \cap W_2) \subset (V_1 \oplus V_3).$$

(ii): Similarly,
$$P_{1+2} - P_1 - P_2 + P_2 P_1 = O \iff (P_{1+2} - P_2)(P_{1+2} - P_1) = O \iff (V_{1+2} \cap W_1) \subset (V_2 \oplus V_3).$$
 Q.E.D.

Corollary Assume that the decomposition (2.21) holds. The necessary and sufficient condition for $P_1P_2 = P_2P_1$ is that both (2.36) and (2.37) hold.

The following theorem can readily be derived from the theorem above.

Theorem 2.17 Let $E^n = (V_1 + V_2) \oplus V_3$, $V_1 = V_{11} \oplus V_{12}$, and $V_2 = V_{22} \oplus V_{12}$, where $V_{12} = V_1 \cap V_2$. Let \mathbf{P}_{1+2}^* denote the projection matrix onto $V_1 + V_2$ along V_3 , and let \mathbf{P}_1^* and \mathbf{P}_2^* denote the projectors onto V_1 along $V_3 \oplus V_{22}$ and onto V_2 along $V_3 \oplus V_{11}$, respectively. Then,

$$P_1^* P_2^* = P_2^* P_1^* \tag{2.38}$$

and

$$P_{1+2}^* = P_1^* + P_2^* - P_1^* P_2^*. (2.39)$$

Proof. Since $V_{11} \subset V_1$ and $V_{22} \subset V_2$, we obtain

$$V_{1+2} \cap W_2 = V_{11} \subset (V_1 \oplus V_3)$$
 and $V_{1+2} \cap W_1 = V_{22} \subset (V_2 \oplus V_3)$

by setting $W_1 = V_{22} \oplus V_3$ and $W_2 = V_{11} \oplus V_3$ in Theorem 2.16.

Another proof. Let $y = y_1 + y_2 + y_{12} + y_3 \in E^n$, where $y_1 \in V_{11}$, $y_2 \in V_{22}$, $y_{12} \in V_{12}$, and $y_3 \in V_3$. Then it suffices to show that $(P_1^*P_2^*)y = (P_2^*P_1^*)y$. Q.E.D.

Let P_j (j=1,2) denote the projection matrix onto V_j along W_j . Assume that $E^n=V_1\oplus W_1\oplus V_3=V_2\oplus W_2\oplus V_3$ and $V_1+V_2=V_{11}\oplus V_{22}\oplus V_{12}$ hold. However, $W_1=V_{22}$ may not hold, even if $V_1=V_{11}\oplus V_{12}$. That is, (2.38) and (2.39) hold only when we set $W_1=V_{22}$ and $W_2=V_{11}$.

Theorem 2.18 Let P_1 and P_2 be the orthogonal projectors onto V_1 and V_2 , respectively, and let P_{1+2} denote the orthogonal projector onto V_{1+2} . Let $V_{12} = V_1 \cap V_2$. Then the following three statements are equivalent:

- (i) $P_1P_2 = P_2P_1$.
- (ii) $P_{1+2} = P_1 + P_2 P_1 P_2$.
- (iii) $V_{11} = V_1 \cap V_{12}^{\perp}$ and $V_{22} = V_2 \cap V_{12}^{\perp}$ are orthogonal.

Proof. (i) \rightarrow (ii): Obvious from Theorem 2.16.

- (ii) \rightarrow (iii): $P_{1+2} = P_1 + P_2 P_1 P_2 \Rightarrow (P_{1+2} P_1)(P_{1+2} P_2) = (P_{1+2} P_2)(P_{1+2} P_1) = O \Rightarrow V_{11}$ and V_{22} are orthogonal.
- (iii) \rightarrow (i): Set $V_3 = (V_1 + V_2)^{\perp}$ in Theorem 2.17. Since V_{11} and V_{22} , and V_1 and V_{22} , are orthogonal, the result follows. Q.E.D.

When P_1 , P_2 , and P_{1+2} are orthogonal projectors, the following corollary holds.

Corollary
$$P_{1+2} = P_1 + P_2 - P_1 P_2 \iff P_1 P_2 = P_2 P_1$$
.

2.3.3 Commutative projectors

In this section, we focus on orthogonal projectors and discuss the meaning of Theorem 2.18 and its corollary. We also generalize the results to the case in which there are three or more subspaces.

Theorem 2.19 Let P_j denote the orthogonal projector onto V_j . If $P_1P_2 = P_2P_1$, $P_1P_3 = P_3P_1$, and $P_2P_3 = P_3P_2$, the following relations hold:

$$V_1 + (V_2 \cap V_3) = (V_1 + V_2) \cap (V_1 + V_3), \tag{2.40}$$

$$V_2 + (V_1 \cap V_3) = (V_1 + V_2) \cap (V_2 + V_3), \tag{2.41}$$

$$V_3 + (V_1 \cap V_2) = (V_1 + V_3) \cap (V_2 + V_3). \tag{2.42}$$

Proof. Let $P_{1+(2\cap 3)}$ denote the orthogonal projector onto $V_1 + (V_2 \cap V_3)$. Then the orthogonal projector onto $V_2 \cap V_3$ is given by P_2P_3 (or by P_3P_2). Since $P_1P_2 = P_2P_1 \Rightarrow P_1P_2P_3 = P_2P_3P_1$, we obtain

$$P_{1+(2\cap3)} = P_1 + P_2P_3 - P_1P_2P_3$$

by Theorem 2.18. On the other hand, from $P_1P_2 = P_2P_1$ and $P_1P_3 = P_3P_1$, the orthogonal projectors onto $V_1 + V_2$ and $V_1 + V_3$ are given by

$$P_{1+2} = P_1 + P_2 - P_1 P_2$$
 and $P_{1+3} = P_1 + P_3 - P_1 P_3$,

respectively, and so $P_{1+2}P_{1+3} = P_{1+3}P_{1+2}$ holds. Hence, the orthogonal projector onto $(V_1 + V_2) \cap (V_1 + V_3)$ is given by

$$(P_1 + P_2 - P_1P_2)(P_1 + P_3 - P_1P_3) = P_1 + P_2P_3 - P_1P_2P_3,$$

which implies $P_{1+(2\cap 3)} = P_{1+2}P_{1+3}$. Since there is a one-to-one correspondence between projectors and subspaces, (2.40) holds.

Relations (2.41) and (2.42) can be similarly proven by noting that $(P_1 + P_2 - P_1 P_2)(P_2 + P_3 - P_2 P_3) = P_2 + P_1 P_3 - P_1 P_2 P_3$ and $(P_1 + P_3 - P_1 P_3)(P_2 + P_3 - P_2 P_3) = P_3 + P_1 P_2 - P_1 P_2 P_3$, respectively.

Q.E.D.

The three identities from (2.40) to (2.42) indicate the distributive law of subspaces, which holds only if the commutativity of orthogonal projectors holds.

We now present a theorem on the decomposition of the orthogonal projectors defined on the sum space $V_1 + V_2 + V_3$ of V_1 , V_2 , and V_3 .

Theorem 2.20 Let P_{1+2+3} denote the orthogonal projector onto $V_1 + V_2 + V_3$, and let P_1 , P_2 , and P_3 denote the orthogonal projectors onto V_1 , V_2 , and V_3 , respectively. Then a sufficient condition for the decomposition

$$P_{1+2+3} = P_1 + P_2 + P_3 - P_1 P_2 - P_2 P_3 - P_3 P_1 + P_1 P_2 P_3$$
 (2.43)

to hold is

$$P_1P_2 = P_2P_1, P_2P_3 = P_3P_2, and P_1P_3 = P_3P_1.$$
 (2.44)

Proof. $P_1P_2 = P_2P_1 \Rightarrow P_{1+2} = P_1 + P_2 - P_1P_2$ and $P_2P_3 = P_3P_2 \Rightarrow P_{2+3} = P_2 + P_3 - P_2P_3$. We therefore have $P_{1+2}P_{2+3} = P_{2+3}P_{1+2}$. We also have $P_{1+2+3} = P_{(1+2)+(1+3)}$, from which it follows that

$$\begin{array}{lcl} \boldsymbol{P}_{1+2+3} & = & \boldsymbol{P}_{(1+2)+(1+3)} = \boldsymbol{P}_{1+2} + \boldsymbol{P}_{1+3} - \boldsymbol{P}_{1+2} \boldsymbol{P}_{1+3} \\ & = & (\boldsymbol{P}_1 + \boldsymbol{P}_2 - \boldsymbol{P}_1 \boldsymbol{P}_2) + (\boldsymbol{P}_1 + \boldsymbol{P}_3 - \boldsymbol{P}_1 \boldsymbol{P}_3) \\ & & - (\boldsymbol{P}_2 \boldsymbol{P}_3 + \boldsymbol{P}_1 - \boldsymbol{P}_1 \boldsymbol{P}_2 \boldsymbol{P}_3) \\ & = & \boldsymbol{P}_1 + \boldsymbol{P}_2 + \boldsymbol{P}_3 - \boldsymbol{P}_1 \boldsymbol{P}_2 - \boldsymbol{P}_2 \boldsymbol{P}_3 - \boldsymbol{P}_1 \boldsymbol{P}_3 + \boldsymbol{P}_1 \boldsymbol{P}_2 \boldsymbol{P}_3. \end{array}$$

An alternative proof. From $P_1P_{2+3} = P_{2+3}P_1$, we have $P_{1+2+3} = P_1 + P_{2+3} - P_1P_{2+3}$. If we substitute $P_{2+3} = P_2 + P_3 - P_2P_3$ into this equation, we obtain (2.43). Q.E.D.

Assume that (2.44) holds, and let

$$egin{aligned} P_{ ilde{1}} &= P_1 - P_1 P_2 - P_1 P_3 + P_1 P_2 P_3, \ P_{ ilde{2}} &= P_2 - P_2 P_3 - P_1 P_2 + P_1 P_2 P_3, \ P_{ ilde{3}} &= P_3 - P_1 P_3 - P_2 P_3 + P_1 P_2 P_3, \ P_{12(3)} &= P_1 P_2 - P_1 P_2 P_3, \ P_{13(2)} &= P_1 P_3 - P_1 P_2 P_3, \ P_{23(1)} &= P_2 P_3 - P_1 P_2 P_3, \end{aligned}$$

and

$$P_{123} = P_1 P_2 P_3.$$

Then,

$$P_{1+2+3} = P_{\tilde{1}} + P_{\tilde{2}} + P_{\tilde{3}} + P_{12(3)} + P_{13(2)} + P_{23(1)} + P_{123}.$$
 (2.45)

Additionally, all matrices on the right-hand side of (2.45) are orthogonal projectors, which are also all mutually orthogonal.

Note Since
$$P_{\tilde{1}} = P_1(I_n - P_{2+3})$$
, $P_{\tilde{2}} = P_2(I_n - P_{1+3})$, $P_{\tilde{3}} = P_3(I - P_{1+2})$, $P_{12(3)} = P_1P_2(I_n - P_3)$, $P_{13(2)} = P_1P_3(I_n - P_2)$, and $P_{23(1)} = P_2P_3(I_n - P_1)$,

the decomposition of the projector $P_{1\cup 2\cup 3}$ corresponds with the decomposition of the subspace $V_1+V_2+V_3$

$$V_1 + V_2 + V_3 = V_{\tilde{1}} \oplus V_{\tilde{2}} \oplus V_{\tilde{3}} \oplus V_{12(3)} \oplus V_{13(2)} \oplus V_{23(1)} \oplus V_{123}, \tag{2.46}$$

where $V_{\tilde{1}} = V_1 \cap (V_2 + V_3)^{\perp}$, $V_{\tilde{2}} = V_2 \cap (V_1 + V_3)^{\perp}$, $V_{\tilde{3}} = V_3 \cap (V_1 + V_2)^{\perp}$, $V_{12(3)} = V_1 \cap V_2 \cap V_3^{\perp}$, $V_{13(2)} = V_1 \cap V_2^{\perp} \cap V_3$, $V_{23(1)} = V_1^{\perp} \cap V_2 \cap V_3$, and $V_{123} = V_1 \cap V_2 \cap V_3$.

Theorem 2.20 can be generalized as follows.

Corollary Let $V = V_1 + V_2 + \cdots + V_s$ $(s \ge 2)$. Let \mathbf{P}_V denote the orthogonal projector onto V, and let \mathbf{P}_j denote the orthogonal projector onto V_j . A sufficient condition for

$$\mathbf{P}_{V} = \sum_{j=1}^{s} \mathbf{P}_{j} - \sum_{i < j} \mathbf{P}_{i} \mathbf{P}_{j} + \sum_{i < j < k} \mathbf{P}_{i} \mathbf{P}_{j} \mathbf{P}_{k} + \dots + (-1)^{s-1} \mathbf{P}_{1} \mathbf{P}_{2} \mathbf{P}_{3} \dots \mathbf{P}_{s}$$

$$(2.47)$$

to hold is

$$\mathbf{P}_i \mathbf{P}_j = \mathbf{P}_j \mathbf{P}_i \ (i \neq j). \tag{2.48}$$

2.3.4 Noncommutative projectors

We now consider the case in which two subspaces V_1 and V_2 and the corresponding projectors P_1 and P_2 are given but $P_1P_2 = P_2P_1$ does not necessarily hold. Let $Q_j = I_n - P_j$ (j = 1, 2). Then the following lemma holds.

Lemma 2.4

$$V_1 + V_2 = \operatorname{Sp}(\boldsymbol{P}_1) \oplus \operatorname{Sp}(\boldsymbol{Q}_1 \boldsymbol{P}_2) \tag{2.49}$$

$$= \operatorname{Sp}(\boldsymbol{Q}_2 \boldsymbol{P}_1) \oplus \operatorname{Sp}(\boldsymbol{P}_2). \tag{2.50}$$

Proof. $[P_1, Q_1P_2]$ and $[Q_2P_1, P_2]$ can be expressed as

$$[oldsymbol{P}_1,oldsymbol{Q}_1oldsymbol{P}_2] = [oldsymbol{P}_1,oldsymbol{P}_2] \left[egin{array}{cc} oldsymbol{I}_n & -oldsymbol{P}_2 \ O & oldsymbol{I}_n \end{array}
ight] = [oldsymbol{P}_1,oldsymbol{P}_2]oldsymbol{S}$$

and

$$[oldsymbol{Q}_2oldsymbol{P}_1,oldsymbol{P}_2] = [oldsymbol{P}_1,oldsymbol{P}_2] \left[egin{array}{cc} oldsymbol{I}_n & oldsymbol{O} \ -oldsymbol{P}_1 & oldsymbol{I}_n \end{array}
ight] = [oldsymbol{P}_1,oldsymbol{P}_2]oldsymbol{T}.$$

Since S and T are nonsingular, we have

$$rank(\boldsymbol{P}_1, \boldsymbol{P}_2) = rank(\boldsymbol{P}_1, \boldsymbol{Q}_1 \boldsymbol{P}_2) = rank(\boldsymbol{Q}_2 \boldsymbol{P}_1, \boldsymbol{P}_1),$$

which implies

$$V_1 + V_2 = \text{Sp}(P_1, Q_1 P_2) = \text{Sp}(Q_2 P_1, P_2).$$

Furthermore, let $P_1x + Q_1P_2y = 0$. Premultiplying both sides by P_1 , we obtain $P_1x = 0$ (since $P_1Q_1 = 0$), which implies $Q_1P_2y = 0$. Hence, $\operatorname{Sp}(P_1)$ and $\operatorname{Sp}(Q_1P_2)$ give a direct-sum decomposition of $V_1 + V_2$, and so do $\operatorname{Sp}(Q_2P_1)$ and $\operatorname{Sp}(P_2)$. Q.E.D.

The following theorem follows from Lemma 2.4.

Theorem 2.21 Let $E^n = (V_1 + V_2) \oplus W$. Furthermore, let

$$V_{2[1]} = \{ \boldsymbol{x} | \boldsymbol{x} = \boldsymbol{Q}_1 \boldsymbol{y}, \boldsymbol{y} \in V_2 \}$$
 (2.51)

and

$$V_{1[2]} = \{ \boldsymbol{x} | \boldsymbol{x} = \boldsymbol{Q}_2 \boldsymbol{y}, \boldsymbol{y} \in V_1 \}.$$
 (2.52)

Let $Q_j = I_n - P_j$ (j = 1, 2), where P_j is the orthogonal projector onto V_j , and let P^* , P_1^* , P_2^* , $P_{1[2]}$, and $P_{2[1]}$ denote the projectors onto $V_1 + V_2$ along W, onto V_1 along $V_{2[1]} \oplus W$, onto V_2 along $V_{1[2]} \oplus W$, onto $V_{1[2]}$ along $V_2 \oplus W$, and onto $V_{2[1]}$ along $V_1 \oplus W$, respectively. Then,

$$P^* = P_1^* + P_{2[1]}^* \tag{2.53}$$

or

$$P^* = P_{1[2]}^* + P_2^* \tag{2.54}$$

holds.

Note When $W = (V_1 + V_2)^{\perp}$, P_j^* is the orthogonal projector onto V_j , while $P_{j[i]}^*$ is the orthogonal projector onto $V_j[i]$.

Corollary Let P denote the orthogonal projector onto $V = V_1 \oplus V_2$, and let P_j (j = 1, 2) be the orthogonal projectors onto V_j . If V_i and V_j are orthogonal, the following equation holds:

$$\boldsymbol{P} = \boldsymbol{P}_1 + \boldsymbol{P}_2. \tag{2.55}$$

2.4 Norm of Projection Vectors

We now present theorems concerning the norm of the projection vector Px $(x \in E^n)$ obtained by projecting x onto Sp(P) along Ker(P) by P.

Lemma 2.5 P' = P and $P^2 = P \iff P'P = P$. (The proof is trivial and hence omitted.)

Theorem 2.22 Let P denote a projection matrix (i.e., $P^2 = P$). The necessary and sufficient condition to have

$$||\mathbf{P}\mathbf{x}|| \le ||\mathbf{x}|| \tag{2.56}$$

for an arbitrary vector \mathbf{x} is

$$P' = P. (2.57)$$

Proof. (Sufficiency) Let x be decomposed as $x = Px + (I_n - P)x$. We have $(Px)'(I_n - P)x = x'(P' - P'P)x = 0$ because $P' = P \Rightarrow P'P = P'$ from Lemma 2.5. Hence,

$$||x||^2 = ||Px||^2 + ||(I_n - P)x||^2 \ge ||Px||^2.$$

(Necessity) By assumption, we have $x'(I_n - P'P)x \ge 0$, which implies $I_n - P'P$ is nnd with all nonnegative eigenvalues. Let $\lambda_1, \lambda_2, \dots, \lambda_n$ denote the eigenvalues of P'P. Then, $1 - \lambda_j \ge 0$ or $0 \ge \lambda_j \ge 1$ $(j = 1, \dots, n)$. Hence, $\sum_{j=1}^n \lambda_j^2 \le \sum_{j=1}^n \lambda_j$, which implies $\operatorname{tr}(P'P)^2 \le \operatorname{tr}(P'P)$.

On the other hand, we have

$$(\operatorname{tr}(\boldsymbol{P}'\boldsymbol{P}))^2 = (\operatorname{tr}(\boldsymbol{P}\boldsymbol{P}'\boldsymbol{P}))^2 \leq \operatorname{tr}(\boldsymbol{P}'\boldsymbol{P})\operatorname{tr}(\boldsymbol{P}'\boldsymbol{P})^2$$

from the generalized Schwarz inequality (set A' = P and B = P'P in (1.19)) and $P^2 = P$. Hence, $\operatorname{tr}(P'P) \leq \operatorname{tr}(P'P)^2 \Rightarrow \operatorname{tr}(P'P) = \operatorname{tr}(P'P)^2$, from which it follows that $\operatorname{tr}\{(P - P'P)'(P - P'P)\} = \operatorname{tr}\{P'P - P'P - P'P - P'P + (P'P)^2\} = \operatorname{tr}\{P'P - (P'P)^2\} = 0$. Thus, $P = P'P \Rightarrow P' = P$. Q.E.D.

Corollary Let M be a symmetric pd matrix, and define the (squared) norm of x by

$$||\boldsymbol{x}||_{M}^{2} = \boldsymbol{x}' \boldsymbol{M} \boldsymbol{x}. \tag{2.58}$$

The necessary and sufficient condition for a projection matrix P (satisfying $P^2 = P$) to satisfy

$$||Px||_M^2 \le ||x||_M^2 \tag{2.59}$$

for an arbitrary n-component vector x is given by

$$(\mathbf{MP})' = \mathbf{MP}.\tag{2.60}$$

Proof. Let $M = U\Delta^2U'$ be the spectral decomposition of M, and let $M^{1/2} = \Delta U'$. Then, $M^{-1/2} = U\Delta^{-1}$. Define $y = M^{1/2}x$, and let $\tilde{P} = M^{1/2}PM^{-1/2}$. Then, $\tilde{P}^2 = \tilde{P}$, and (2.58) can be rewritten as $||\tilde{P}y||^2 \le ||y||^2$. By Theorem 2.22, the necessary and sufficient condition for (2.59) to hold is given by

$$\tilde{P}^2 = \tilde{P} \Longrightarrow (M^{1/2}PM^{-1/2})' = M^{1/2}PM^{-1/2},$$
 (2.61)

leading to
$$(2.60)$$
. Q.E.D.

Note The theorem above implies that with an oblique projector P ($P^2 = P$, but $P' \neq P$) it is possible to have $||Px|| \geq ||x||$. For example, let

$$P = \begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix}$$
 and $x = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$.

Then, ||Px|| = 2 and $||x|| = \sqrt{2}$.

Theorem 2.23 Let P_1 and P_2 denote the orthogonal projectors onto V_1 and V_2 , respectively. Then, for an arbitrary $\mathbf{x} \in E^n$, the following relations hold:

$$||P_2P_1x|| < ||P_1x|| < ||x||$$
 (2.62)

and, if $V_2 \subset V_1$,

$$||P_2x|| \le ||P_1x||. \tag{2.63}$$

Proof. (2.62): Replace x by P_1x in Theorem 2.22.

(2.63): By Theorem 2.11, we have $P_1P_2 = P_2$, from which (2.63) follows immediately.

Let x_1, x_2, \dots, x_p represent p n-component vectors in E^n , and define $X = [x_1, x_2, \dots, x_p]$. From (1.15) and P = P'P, the following identity holds:

$$||Px_1||^2 + ||Px_2||^2 + \dots + ||Px_p||^2 = \operatorname{tr}(X'PX).$$
 (2.64)

The above identity and Theorem 2.23 lead to the following corollary.

Corollary

- (i) If $V_2 \subset V_1$, $\operatorname{tr}(X'P_2X) \leq \operatorname{tr}(X'P_1X) \leq \operatorname{tr}(X'X)$.
- (ii) Let P denote an orthogonal projector onto an arbitrary subspace in E^n . If $V_1 \supset V_2$,

$$\operatorname{tr}(\boldsymbol{P}_1\boldsymbol{P}) \geq \operatorname{tr}(\boldsymbol{P}_2\boldsymbol{P}).$$

Proof. (i): Obvious from Theorem 2.23. (ii): We have $\operatorname{tr}(\boldsymbol{P}_{j}\boldsymbol{P}) = \operatorname{tr}(\boldsymbol{P}_{j}\boldsymbol{P}^{2})$ = $\operatorname{tr}(\boldsymbol{P}\boldsymbol{P}_{j}\boldsymbol{P})$ (j=1,2), and $(\boldsymbol{P}_{1}-\boldsymbol{P}_{2})^{2}=\boldsymbol{P}_{1}-\boldsymbol{P}_{2}$, so that

$$\operatorname{tr}(\boldsymbol{P}\boldsymbol{P}_1\boldsymbol{P}) - \operatorname{tr}(\boldsymbol{P}\boldsymbol{P}_2\boldsymbol{P}) = \operatorname{tr}(\boldsymbol{S}\boldsymbol{S}') \ge 0,$$

where
$$S = (P_1 - P_2)P$$
. It follows that $tr(P_1P) \ge tr(P_2P)$.
Q.E.D.

We next present a theorem on the trace of two orthogonal projectors.

Theorem 2.24 Let P_1 and P_2 be orthogonal projectors of order n. Then the following relations hold:

$$\operatorname{tr}(\boldsymbol{P}_1\boldsymbol{P}_2) = \operatorname{tr}(\boldsymbol{P}_2\boldsymbol{P}_1) \le \min(\operatorname{tr}(\boldsymbol{P}_1), \operatorname{tr}(\boldsymbol{P}_2)). \tag{2.65}$$

Proof. We have $\operatorname{tr}(\boldsymbol{P}_1) - \operatorname{tr}(\boldsymbol{P}_1\boldsymbol{P}_2) = \operatorname{tr}(\boldsymbol{P}_1(\boldsymbol{I}_n - \boldsymbol{P}_2)) = \operatorname{tr}(\boldsymbol{P}_1\boldsymbol{Q}_2) = \operatorname{tr}(\boldsymbol{P}_1\boldsymbol{Q}_2\boldsymbol{P}_1) = \operatorname{tr}(\boldsymbol{S}'\boldsymbol{S}) \geq 0$, where $\boldsymbol{S} = \boldsymbol{Q}_2\boldsymbol{P}_1$, establishing $\operatorname{tr}(\boldsymbol{P}_1) \geq \operatorname{tr}(\boldsymbol{P}_1\boldsymbol{P}_2)$. Similarly, (2.65) follows from $\operatorname{tr}(\boldsymbol{P}_2) \geq \operatorname{tr}(\boldsymbol{P}_1\boldsymbol{P}_2) = \operatorname{tr}(\boldsymbol{P}_2\boldsymbol{P}_1)$. Q.E.D.

Note From (1.19), we obtain

$$\operatorname{tr}(\boldsymbol{P}_1 \boldsymbol{P}_2) \le \sqrt{\operatorname{tr}(\boldsymbol{P}_1)\operatorname{tr}(\boldsymbol{P}_2)}. \tag{2.66}$$

However, (2.65) is more general than (2.66) because $\sqrt{\operatorname{tr}(\boldsymbol{P}_1)\operatorname{tr}(\boldsymbol{P}_2)} \ge \min(\operatorname{tr}(\boldsymbol{P}_1), \operatorname{tr}(\boldsymbol{P}_2))$.

2.5 Matrix Norm and Projection Matrices

Let $\mathbf{A} = [a_{ij}]$ be an n by p matrix. We define its Euclidean norm (also called the Frobenius norm) by

$$||\mathbf{A}|| = \{\operatorname{tr}(\mathbf{A}'\mathbf{A})\}^{1/2} = \sqrt{\sum_{i=1}^{n} \sum_{j=1}^{p} a_{ij}^{2}}.$$
 (2.67)

Then the following four relations hold.

Lemma 2.6

$$||\mathbf{A}|| > 0. \tag{2.68}$$

$$||CA|| \le ||C|| \cdot ||A||,$$
 (2.69)

Let both A and B be n by p matrices. Then,

$$||A + B|| \le ||A|| + ||B||.$$
 (2.70)

Let U and V be orthogonal matrices of orders n and p, respectively. Then

$$||UAV|| = ||A||. \tag{2.71}$$

Proof. Relations (2.68) and (2.69) are trivial. Relation (2.70) follows immediately from (1.20). Relation (2.71) is obvious from

$$\mathrm{tr}(V'A'U'UAV) = \mathrm{tr}(A'AVV') = \mathrm{tr}(A'A).$$
 Q.E.D.

Note Let M be a symmetric nnd matrix of order n. Then the norm defined in (2.67) can be generalized as

$$||\mathbf{A}||_{M} = \{ \operatorname{tr}(\mathbf{A}' \mathbf{M} \mathbf{A}) \}^{1/2}.$$
 (2.72)

This is called the norm of A with respect to M (sometimes called a metric matrix). Properties analogous to those given in Lemma 2.6 hold for this generalized norm.

There are other possible definitions of the norm of A. For example,

- (i) $||\mathbf{A}||_1 = \max_j \sum_{i=1}^n |a_{ij}|,$
- (ii) $||\mathbf{A}||_2 = \mu_1(\mathbf{A})$, where $\mu_1(\mathbf{A})$ is the largest singular value of \mathbf{A} (see Chapter 5), and
- (iii) $||A||_3 = \max_i \sum_{j=1}^p |a_{ij}|.$

All of these norms satisfy (2.68), (2.69), and (2.70). (However, only $||\mathbf{A}||_2$ satisfies (2.71).)

Lemma 2.7 Let P and \tilde{P} denote orthogonal projectors of orders n and p, respectively. Then,

$$||PA|| \le ||A|| \tag{2.73}$$

(the equality holds if and only if PA = A) and

$$||\mathbf{A}\tilde{\mathbf{P}}|| \le ||\mathbf{A}|| \tag{2.74}$$

(the equality holds if and only if $A\tilde{P} = A$).

Proof. (2.73): Square both sides and subtract the right-hand side from the left. Then,

$$tr(\mathbf{A}'\mathbf{A}) - tr(\mathbf{A}'\mathbf{P}\mathbf{A}) = tr\{\mathbf{A}'(\mathbf{I}_n - \mathbf{P})\mathbf{A}\}$$
$$= tr(\mathbf{A}'\mathbf{Q}\mathbf{A}) = tr(\mathbf{Q}\mathbf{A})'(\mathbf{Q}\mathbf{A}) \ge 0 \text{ (where } \mathbf{Q} = \mathbf{I}_n - \mathbf{P}).$$

The equality holds when $QA = O \iff PA = A$.

(2.74): This can be proven similarly by noting that $||A\tilde{P}||^2 = \operatorname{tr}(\tilde{P}A'A\tilde{P})$ = $\operatorname{tr}(A\tilde{P}A') = ||\tilde{P}A'||^2$. The equality holds when $\tilde{Q}A' = O \iff \tilde{P}A' = A' \iff A\tilde{P} = A$, where $\tilde{Q} = I_n - \tilde{P}$. Q.E.D.

The two lemmas above lead to the following theorem.

Theorem 2.25 Let A be an n by p matrix, B and Y n by r matrices, and C and X r by p matrices. Then,

$$||A - BX|| \ge ||(I_n - P_B)A||,$$
 (2.75)

where P_B is the orthogonal projector onto Sp(B). The equality holds if and only if $BX = P_B A$. We also have

$$||A - YC|| \ge ||A(I_p - P_{C'})||,$$
 (2.76)

where $P_{C'}$ is the orthogonal projector onto $\operatorname{Sp}(C')$. The equality holds if and only if $YC = AP_{C'}$. We also have

$$||A - BX - YC|| \ge ||(I_n - P_B)A(I_p - P_{C'})||.$$
 (2.77)

The equality holds if and only if

$$P_B(A - YC) = BX \text{ and } (I_n - P_B)AP_{C'} = (I_n - P_B)YC \qquad (2.78)$$

or

$$(A - BX)P_{C'} = YC \text{ and } P_B A(I_p - P_{C'}) = BX(I_n - P_{C'}).$$
 (2.79)

Proof. (2.75): We have $(I_n - P_B)(A - BX) = A - BX - P_BA + BX = (I_n - P_B)A$. Since $I_n - P_B$ is an orthogonal projector, we have $||A - BX|| \ge ||(I_n - P_B)(A - BX)|| = ||(I_n - P_B)A||$ by (2.73) in Lemma 2.7. The equality holds when $(I_n - P_B)(A - BX) = A - BX$, namely $P_BA = BX$.

(2.76): It suffices to use $(A - YC)(I_p - P_{C'}) = A(I_p - P_{C'})$ and (2.74) in Lemma 2.7. The equality holds when $(A - YC)(I_p - P_{C'}) = A - YC$ holds, which implies $YC = AP_{C'}$.

(2.77): $||A-BX-YC|| \ge ||(I_n-P_B)(A-YC)|| \ge ||(I_n-P_B)A(I_p-P_{C'})||$ or $||A-BX-YC|| \ge ||(A-BX)(I_p-P_{C'})|| \ge ||(I_p-P_B)A(I_p-P_{C'})||$. The first equality condition (2.78) follows from the first relation above, and the second equality condition (2.79) follows from the second relation above. Q.E.D.

Note Relations (2.75), (2.76), and (2.77) can also be shown by the least squares method. Here we show this only for (2.77). We have

$$\begin{aligned} ||A - BX - YC||^2 &= \operatorname{tr}\{(A - BX - YC)'(A - BX - YC)\}\\ &= \operatorname{tr}(A - YC)'(A - YC) - 2\operatorname{tr}(BX)'(A - YC) + \operatorname{tr}(BX)'(BX) \end{aligned}$$

to be minimized. Differentiating the criterion above by X and setting the result to zero, we obtain B'(A - YC) = B'BX. Premultiplying this equation by $B(B'B)^{-1}$, we obtain $P_B(A - YC) = BX$. Furthermore, we may expand the criterion above as

$$\operatorname{tr}(\boldsymbol{A} - \boldsymbol{B}\boldsymbol{X})'(\boldsymbol{A} - \boldsymbol{B}\boldsymbol{X}) - 2\operatorname{tr}(\boldsymbol{Y}\boldsymbol{C}(\boldsymbol{A} - \boldsymbol{B}\boldsymbol{X})') + \operatorname{tr}(\boldsymbol{Y}\boldsymbol{C})(\boldsymbol{Y}\boldsymbol{C})'.$$

Differentiating this criterion with respect to Y and setting the result equal to zero, we obtain C(A - BX) = CC'Y' or (A - BX)C' = YCC'. Postmultiplying the latter by $(CC')^{-1}C'$, we obtain $(A - BX)P_{C'} = YC$. Substituting this into $P_B(A - YC) = BX$, we obtain $P_BA(I_p - P_{C'}) = BX(I_p - P_{C'})$ after some simplification. If, on the other hand, $BX = P_B(A - YC)$ is substituted into $(A - BX)P_{C'} = YC$, we obtain $(I_n - P_B)AP_{C'} = (I_n - P_B)YC$. (In the derivation above, the regular inverses can be replaced by the respective generalized inverses. See the next chapter.)

2.6 General Form of Projection Matrices

The projectors we have been discussing so far are based on Definition 2.1, namely square matrices that satisfy $P^2 = P$ (idempotency). In this section, we introduce a generalized form of projection matrices that do not necessarily satisfy $P^2 = P$, based on Rao (1974) and Rao and Yanai (1979).

Definition 2.3 Let $V \subset E^n$ (but $V \neq E^n$) be decomposed as a direct-sum of m subspaces, namely $V = V_1 \oplus V_2 \oplus \cdots \oplus V_m$. A square matrix \mathbf{P}_j^* of order n that maps an arbitrary vector \mathbf{y} in V into V_j is called the projection matrix onto V_j along $V_{(j)} = V_1 \oplus \cdots \oplus V_{j-1} \oplus V_{j+1} \oplus \cdots \oplus V_m$ if and only if

$$P_j^* x = x \quad \forall x \in V_j \quad (j = 1, \dots, m)$$
 (2.80)

and

$$P_j^* x = 0 \quad \forall x \in V_{(j)} \ (j = 1, \dots, m).$$
 (2.81)

Let $x_i \in V_i$. Then any $x \in V$ can be expressed as

$$x = x_1 + x_2 + \cdots + x_m = (P_1^* + P_2^* + \cdots P_m^*)x.$$

Premultiplying the equation above by P_i^* , we obtain

$$P_i^* P_i^* x = 0 \ (i \neq j) \text{ and } (P_i^*)^2 x = P_i^* x \ (i = 1, \dots, m)$$
 (2.82)

since $\operatorname{Sp}(\boldsymbol{P}_1), \operatorname{Sp}(\boldsymbol{P}_2), \cdots, \operatorname{Sp}(\boldsymbol{P}_m)$ are mutually disjoint. However, \boldsymbol{V} does not cover the entire E^n ($\boldsymbol{x} \in V \neq E^n$), so (2.82) does not imply $(\boldsymbol{P}_j^*)^2 = \boldsymbol{P}_j^*$ or $\boldsymbol{P}_i^* \boldsymbol{P}_j^* = \boldsymbol{O}$ ($i \neq j$).

Let V_1 and $V_2 \in E^3$ denote the subspaces spanned by $e_1 = (0, 0, 1)'$ and $e_2 = (0, 1, 0)'$, respectively. Suppose

$$\mathbf{P}^* = \left[\begin{array}{ccc} a & 0 & 0 \\ b & 0 & 0 \\ c & 0 & 1 \end{array} \right].$$

Then, $P^*e_1 = e_1$ and $P^*e_2 = 0$, so that P^* is the projector onto V_1 along V_2 according to Definition 2.3. However, $(P^*)^2 \neq P^*$ except when a = b = 0, or a = 1 and c = 0. That is, when V does not cover the entire space E^n , the projector P_j^* in the sense of Definition 2.3 is not idempotent. However, by specifying a complement subspace of V, we can construct an idempotent matrix from P_j^* as follows.

Theorem 2.26 Let P_j^* $(j = 1, \dots, m)$ denote the projector in the sense of Definition 2.3, and let P denote the projector onto V along V_{m+1} , where $V = V_1 \oplus V_2 \oplus \cdots \oplus V_m$ is a subspace in E^n and where V_{m+1} is a complement subspace to V. Then,

$$P_j = P_j^* P \ (j = 1, \dots m) \ and \ P_{m+1} = I_n - P$$
 (2.83)

are projectors (in the sense of Definition 2.1) onto V_j $(j=1,\cdots,m+1)$ along $V_{(j)}^*=V_1\oplus\cdots\oplus V_{j-1}\oplus V_{j+1}\oplus\cdots\oplus V_m\oplus V_{m+1}$.

Proof. Let $x \in V$. If $x \in V_j$ $(j = 1, \dots, m)$, we have $P_j^* P x = P_j^* x = x$. On the other hand, if $x \in V_i$ $(i \neq j, i = 1, \dots, m)$, we have $P_j^* P x = P_j^* x = 0$. Furthermore, if $x \in V_{m+1}$, we have $P_j^* P x = 0$ $(j = 1, \dots, m)$. On the other hand, if $x \in V$, we have $P_{m+1}x = (I_n - P)x = x - x = 0$, and if $x \in V_{m+1}$, $P_{m+1}x = (I_n - P)x = x - 0 = x$. Hence, by Theorem 2.2, P_j $(j = 1, \dots, m+1)$ is the projector onto V_j along $V_{(j)}$. Q.E.D.

2.7 Exercises for Chapter 2

1. Let
$$\tilde{\boldsymbol{A}} = \left[\begin{array}{cc} \boldsymbol{A}_1 & \boldsymbol{O} \\ \boldsymbol{O} & \boldsymbol{A}_2 \end{array} \right]$$
 and $\boldsymbol{A} = \left[\begin{array}{cc} \boldsymbol{A}_1 \\ \boldsymbol{A}_2 \end{array} \right]$. Show that $\boldsymbol{P}_{\tilde{\boldsymbol{A}}} \boldsymbol{P}_{\boldsymbol{A}} = \boldsymbol{P}_{\boldsymbol{A}}$.

- 2. Let P_A and P_B denote the orthogonal projectors onto $\operatorname{Sp}(A)$ and $\operatorname{Sp}(B)$, respectively. Show that the necessary and sufficient condition for $\operatorname{Sp}(A) = \{\operatorname{Sp}(A) \cap \operatorname{Sp}(B)\} \stackrel{\cdot}{\oplus} \{\operatorname{Sp}(A) \cap \operatorname{Sp}(B)^{\perp}\}$ is $P_A P_B = P_B P_A$.
- 3. Let P be a square matrix of order n such that $P^2 = P$, and suppose

$$||\boldsymbol{P}\boldsymbol{x}|| = ||\boldsymbol{x}||$$

for any n-component vector x. Show the following:

- (i) When $x \in (\text{Ker}(P))^{\perp}$, Px = x.
- (ii) $\mathbf{P}' = \mathbf{P}$.
- 4. Let $\operatorname{Sp}(\mathbf{A}) = \operatorname{Sp}(\mathbf{A}_1) \oplus \cdots \oplus \operatorname{Sp}(\mathbf{A}_m)$, and let \mathbf{P}_j $(j = 1, \dots, m)$ denote the projector onto $\operatorname{Sp}(\mathbf{A}_j)$. For $\forall \mathbf{x} \in E^n$:
- (i) Show that

$$||x||^2 \ge ||P_1x||^2 + ||P_2x||^2 + \dots + ||P_mx||^2.$$
 (2.84)

(Also, show that the equality holds if and only if $\operatorname{Sp}(\mathbf{A}) = E^n$.)

- (ii) Show that $\operatorname{Sp}(A_i)$ and $\operatorname{Sp}(A_j)$ $(i \neq j)$ are orthogonal if $\operatorname{Sp}(A) = \operatorname{Sp}(A_1) \oplus \operatorname{Sp}(A_2) \oplus \cdots \oplus \operatorname{Sp}(A_m)$ and the inequality in (i) above holds.
- (iii) Let $P_{[j]} = P_1 + P_2 + \cdots + P_j$. Show that

$$||P_{[m]}x|| \ge ||P_{[m-1]}x|| \ge \cdots \ge ||P_{[2]}x|| \ge ||P_{[1]}x||.$$

- **5**. Let $E^n = V_1 \oplus W_1 = V_2 \oplus W_2 = V_3 \oplus W_3$, and let \mathbf{P}_j denote the projector onto V_j (j = 1, 2, 3) along W_j . Show the following:
- (i) Let $P_iP_j = O$ for $i \neq j$. Then, $P_1 + P_2 + P_3$ is the projector onto $V_1 + V_2 + V_3$ along $W_1 \cap W_2 \cap W_3$.
- (ii) Let $P_1P_2 = P_2P_1$, $P_1P_3 = P_3P_1$, and $P_2P_3 = P_3P_2$. Then $P_1P_2P_3$ is the projector onto $V_1 \cap V_2 \cap V_3$ along $W_1 + W_2 + W_3$.
- (iii) Suppose that the three identities in (ii) hold, and let P_{1+2+3} denote the projection matrix onto $V_1 + V_2 + V_3$ along $W_1 \cap W_2 \cap W_3$. Show that

$$P_{1+2+3} = P_1 + P_2 + P_3 - P_1 P_2 - P_2 P_3 - P_1 P_3 + P_1 P_2 P_3.$$

6. Show that

$$\boldsymbol{Q}_{[A,B]} = \boldsymbol{Q}_A \boldsymbol{Q}_{Q_A B},$$

where $Q_{[A,B]}$, Q_A , and Q_{Q_AB} are the orthogonal projectors onto the null space of [A,B], onto the null space of A, and onto the null space of Q_AB , respectively.

7. (a) Show that

$$\boldsymbol{P}_X = \boldsymbol{P}_{XA} + \boldsymbol{P}_{X(X'X)^{-1}B},$$

where P_X , P_{XA} , and $P_{X(X'X)^{-1}B}$ are the orthogonal projectors onto Sp(X), Sp(XA), and $Sp(X(X'X)^{-1}B)$, respectively, and A and B are such that Ker(A') = Sp(B).

(b) Use the decomposition above to show that

$$P_{[X_1,X_2]} = P_{X_1} + P_{Q_{X_1}X_2},$$

where $X = [X_1, X_2]$, $P_{Q_{X_1}X_2}$ is the orthogonal projector onto $Sp(Q_{X_1}X_2)$, and $Q_{X_1} = I - X_1(X_1'X_1)^{-1}X_1'$.

- 8. Let $E^n = V_1 \oplus W_1 = V_2 \oplus W_2$, and let $P_1 = P_{V_1 \cdot W_1}$ and $P_2 = P_{V_2 \cdot W_2}$ be two projectors (not necessarily orthogonal) of the same size. Show the following:
- (a) The necessary and sufficient condition for P_1P_2 to be a projector is $V_{12} \subset V_2 \oplus (W_1 \cap W_2)$, where $V_{12} = \operatorname{Sp}(P_1P_2)$ (Brown and Page, 1970).
- (b) The condition in (a) is equivalent to $V_2 \subset V_1 \oplus (W_1 \cap V_2) \oplus (W_1 \cap W_2)$ (Werner, 1992).
- 9. Let A and B be n by a $(n \ge a)$ and n by b $(n \ge b)$ matrices, respectively. Let P_A and P_B be the orthogonal projectors defined by A and B, and let Q_A and Q_B be their orthogonal complements. Show that the following six statements are equivalent: (1) $P_A P_B = P_B P_A$, (2) $A'B = A' P_B P_A B$, (3) $(P_A P_B)^2 = P_A P_B$, (4) $P_{[A,B]} = P_A + P_B P_A P_B$, (5) $A' Q_B Q_A B = O$, and (6) $\operatorname{rank}(Q_A B) = \operatorname{rank}(B) \operatorname{rank}(A'B)$.
